

Fill the grid with the digits 0, 2 and 5. The digits must add up to the specified row and column sums. In each shape in the grid, all squares must contain the same digit. A second sum is also given for each row and column. The second sum assumes that a row or column from the grid is missing. Find the missing row and column in the grids and shade it or cross it out.

This column totals 8, but totals 6 when the missing row is gone. So the missing row must have a 2 in this column.

In the sample puzzle on the right, the missing row and column are shaded gray.
