# Flip Mirror 0-2-5

Instructions

For each pair of grids, fill cells with either 0, 2, or 5, with each bordered region containing the same digit in each cell, so that the numbers outside the grid correctly display the sum of the digits in that position's line of sight.

Each pair of grids contain the same numbers in the same positions, but with the mirrors oriented in different directions in each grid.
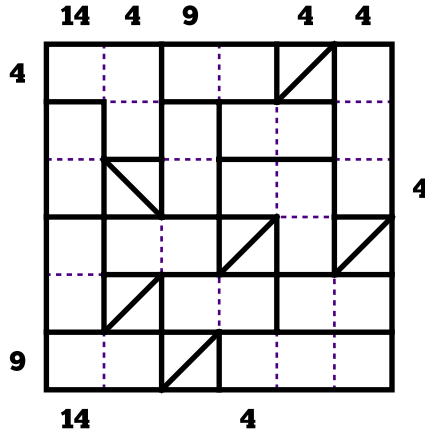

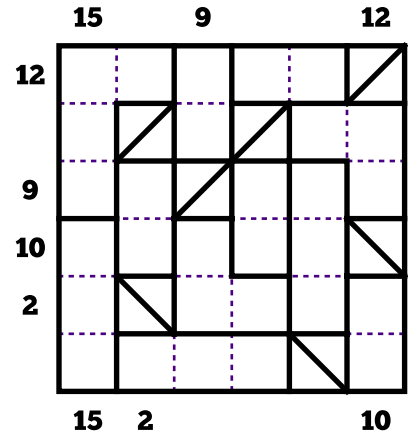

An example of line of sight with mirrors is shown below:

The given positions on the top right and bottom left show a sum of 9 because the mirror reflects the line of sight.
